

# System Engineering for the breakout sessions

- Goals:

- (1) list what **measurement requirements** we need to have specified, and what is reasonable for the simulators/modelers to consider
- (2) discuss what **interfaces exist between other instrumental components** (boxes from my plenary)
- (3) list the degrees of freedom (DOF) we have to tune to meet these requirements

- Outputs:

- the lists from point (1) and (3) are what we will report back since (3) tells the simulators what to consider, and (1) gives them our understanding of what we need to know
